IPRPS OS — What It Is and What It Can Do

Reference guide for users · Updated November 3, 2026

IPRPS OS wallpaper artwork

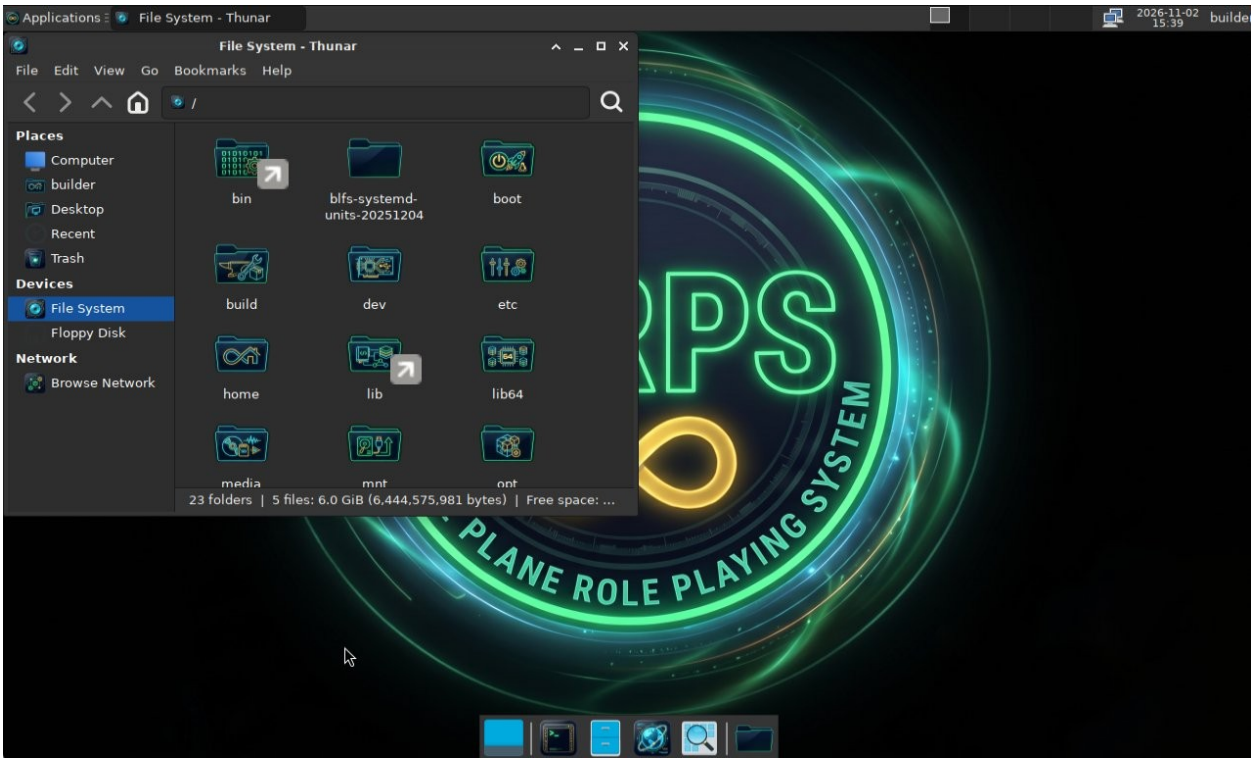

What IPRPS OS is

IPRPS OS is a free, ready-to-use operating system for running and creating tabletop role-playing games, built around the Infinite Plane Role Playing System (IPRPS) by Mythical Legends Publishing. It turns an ordinary 64-bit PC into a Session Master's workstation: your campaign apps on one home page, play over the local network with your players' own phones and tablets, character sheets, an initiative and combat tracker, dice, a session log, a soundboard, writing, art and video tools, and (in Medium and Advanced) a storyteller AI that runs entirely on your computer.

- **Built for the table.** The desktop, menus and apps are organized around preparing and running sessions, not around office work.
- **Local-first.** Campaign data lives in a database on your own computer. The IPRPS apps run on a built-in web server that only your computer can reach, and they work without internet.
- **Players join from their own devices.** The **IPRPS Table** lets anyone on the same Wi-Fi join your campaign from a phone, tablet or laptop, so a second screen is optional.
- **Keeps itself up to date. IPRPS Updates** installs security fixes and new versions of the IPRPS apps without reinstalling.
- **Built from source.** IPRPS OS is built with Linux From Scratch and Beyond Linux From Scratch, the community books for building a Linux system from source code. It isn't a re-skin of another distribution.

- **Three editions.** Lite, Medium and Advanced, so it fits anything from an older laptop to a creative studio PC.

> **SIDE NOTE** IPRPS OS 1.0 is in its final testing. Lite is released as a beta; Medium and Advanced follow. The screenshots in this guide are from the Advanced edition in testing.

The IPRPS Desktop: the IPRPS wallpaper, the dock, and the file manager with IPRPS icons for every system folder

Who it's for

IPRPS OS is for anyone who runs, writes or produces role-playing games and wants their tools in one dedicated system.

You are	What IPRPS OS gives you
Session Master running a regular table	Session Master Mode: your campaign apps, ambience and either a player display or the IPRPS Table, opened with one click; combat tracker, dice, soundboard and session log for the night itself
Session Master with one screen	The IPRPS Table: players follow along, chat, roll dice and fill in their character sheets on their own phones and laptops while you push maps, handouts and music to them
Storyteller or worldbuilder	IPRPS Writer, the IPRPS Oracle for NPCs, creatures and plot hooks (Medium and up), LibreOffice, and a database for campaigns, sessions and character sheets
Content creator (art, maps, audio, video)	Image, vector, audio and video editors, plus IPRPS production apps such as Lookbook Studio and THE DIRECTOR (Advanced)
Gaming group sharing one machine	One account per person, with each person's campaigns, documents, color scheme and app choices kept separate
Game club, school or library	A low-cost, consistent setup that runs on donated or older PCs (Lite)
Owner of an older PC	The Lite edition runs on 6 GB of RAM, on computers that use legacy BIOS, and on desktops with a single display output

Is it right for you?

IPRPS OS is a good fit if your computer is mainly for preparing and running games, writing and creating. It's a poor fit if you depend on Windows-only software.

A good fit if you:

- want one dedicated machine for game nights, prep and creative work
- prefer your campaign and player data stored on your own computer
- run games in person, with a TV, projector or second monitor, or with players' phones and tablets on the same Wi-Fi
- write, draw, record or edit video for your campaigns or setting
- want AI help at the table without sending your campaign to an online service (Medium and Advanced)
- have a 64-bit Intel or AMD PC from roughly the last 10 to 12 years

Not a good fit (yet) if you:

- need Windows or Mac software, such as Windows-only games, Microsoft Office or Adobe apps
- need a computer that requires **Secure Boot** to stay on (common on locked-down work PCs)
- want to keep Windows on the same disk: the 1.0 installer erases the target disk, so dual boot isn't supported
- have a 32-bit-only PC or an Apple Silicon Mac (M1 or later)
- rely on NVIDIA's proprietary driver for gaming or GPU computing; NVIDIA cards run on the open-source driver with limited performance

> SIDE NOTE **Try before you commit.** IPRPS OS runs straight from a USB stick or a live DVD, or in a virtual machine on Windows, without changing your computer (see *Getting IPRPS OS*).

The three editions

All three editions share the same desktop, web server, database, updates and campaign tools. Each step up adds more apps, so pick the one that matches your computer and what you create.

	Lite	Medium	Advanced
Best for	Running games; older or modest PCs	Most Session Masters and Storytellers	Content creators and power users
Memory (RAM)	6 GB minimum	8 GB minimum, 16 GB recommended	16 GB recommended
Storage	64 GB or more	64 GB or more	128 GB or more
Campaign tools	Session Master Hub, IPRPS Table, Character Sheets and Character Creator, Combat Tracker, Dice Roller, Session Log, Soundboard, IPRPS Writer, File Viewer, player display	Same, plus more IPRPS apps	All IPRPS apps
Local AI	—	**IPRPS Oracle** (storyteller model included)	IPRPS Oracle
Web browser	Firefox	Chromium (default; IPRPS apps open in their own windows) and Firefox	Same as Medium
Documents	IPRPS Writer (.docx, .odt, PDF), Evince (PDF), Mousepad (text)	+ LibreOffice, printing	+ scanning, Calibre (e-books)
Images	Ristretto (viewer), Drawing (simple painting)	+ GIMP, Inkscape, ImageMagick	+ FontForge, Graphviz, Krita, Blender
Audio	Parole (music and ambience)	+ VLC	+ Audacity, LMMS
Video	mpv	+ VLC, FFmpeg	+ Shotcut, Kdenlive
Publishing	—	—	+ Scribus, Calibre, Pandoc
Discs	—	Xfburn (burning)	+ disc mastering tools

These RAM amounts are for smooth everyday use. **Lite runs well on 6 GB.** Medium and Advanced start on 6 GB too, but feel slow there with several large apps open (Chromium, LibreOffice, GIMP, Blender or a video editor), and the IPRPS Oracle's AI model uses several gigabytes of its own while it answers. IPRPS OS creates a swap file at first boot, which helps when memory runs short, at the cost of speed.

You can start with Lite and add software later: **IPRPS Updates** offers IPRPS apps and optional software your edition doesn't include, when your computer can run them. Moving to a higher edition as a whole means a fresh install, so back up your campaign data first.

System requirements

Any 64-bit Intel or AMD PC with 6 GB of RAM and 64 GB of storage (128 GB for Advanced) can run IPRPS OS Lite; 16 GB of RAM is recommended for Medium and Advanced.

Item	Minimum	Recommended
Processor	64-bit Intel or AMD (x86-64)	4 or more cores; for the IPRPS Oracle, a processor with AVX2 (most Intel and AMD processors from 2013 or later)
Memory (RAM)	6 GB (Lite), 8 GB (Medium)	16 GB
Storage	64 GB (128 GB for Advanced)	SSD, 128 GB or more
Firmware	UEFI or legacy BIOS	UEFI
Secure Boot	Must be **off**	Off
Graphics	Intel, AMD or NVIDIA (open-source drivers)	Intel or AMD (a Vulkan-capable GPU speeds up the Oracle)
Network	Wired or Wi-Fi (most common chips supported)	Wi-Fi or wired, for the IPRPS Table
Second screen	Optional	TV, projector or monitor for the player display; otherwise the IPRPS Table
Players' devices	Optional	Any phone, tablet or computer with a web browser, on the same network
Internet	Not needed to run games	Needed for downloads, updates and online AI apps

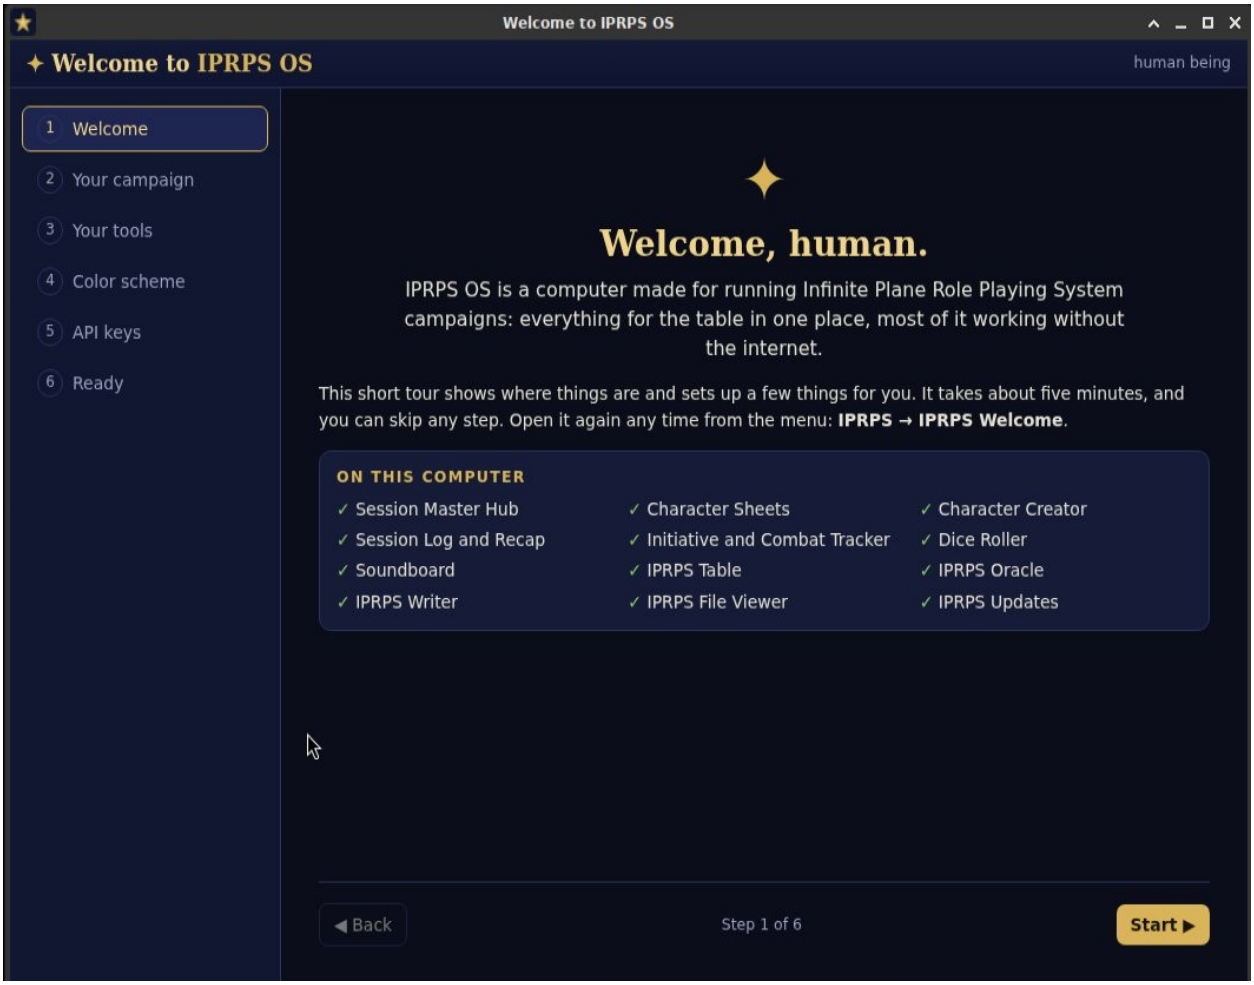

SIDE NOTE **Secure Boot** is a firmware setting. You turn it off once in the computer's setup screen (usually opened with F2, Del or F10 at power-on).

What you can do

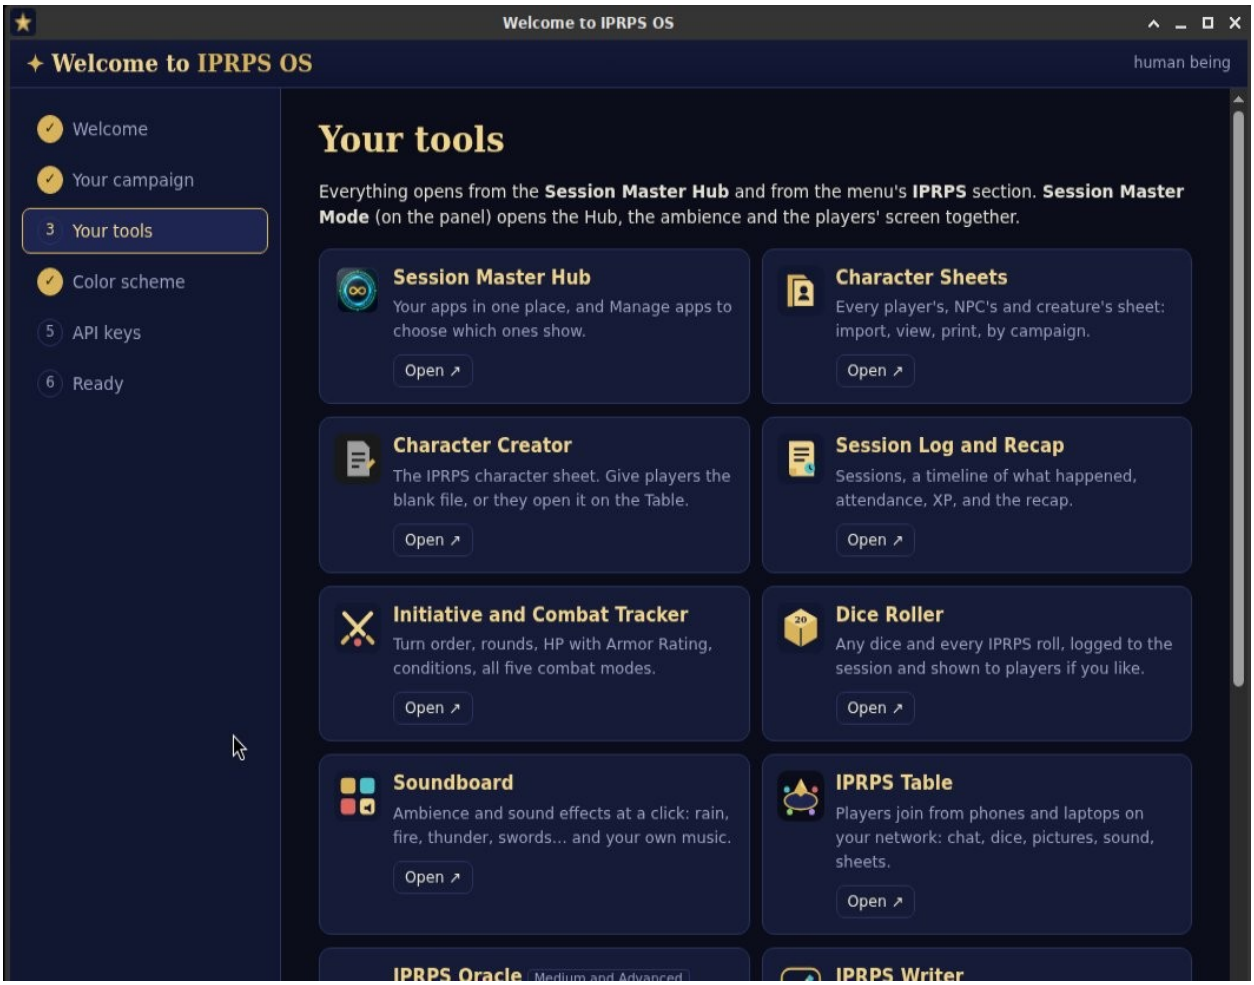

IPRPS OS covers the whole cycle of a campaign: prepare it, run it at the table, track what happened, and turn it into something you can publish or share.

Your first login: IPRPS Welcome

At each person's first login, **IPRPS Welcome** opens a short tour: what's installed on this computer, your first campaign, where your tools are, a **color scheme** (Night, Parchment, Forest or High contrast) for the IPRPS session tools, and a protected place for the **API keys** of online AI apps. Open it again any time from the menu (**IPRPS → IPRPS Welcome**).

IPRPS Welcome: the first step lists the IPRPS apps on this computer

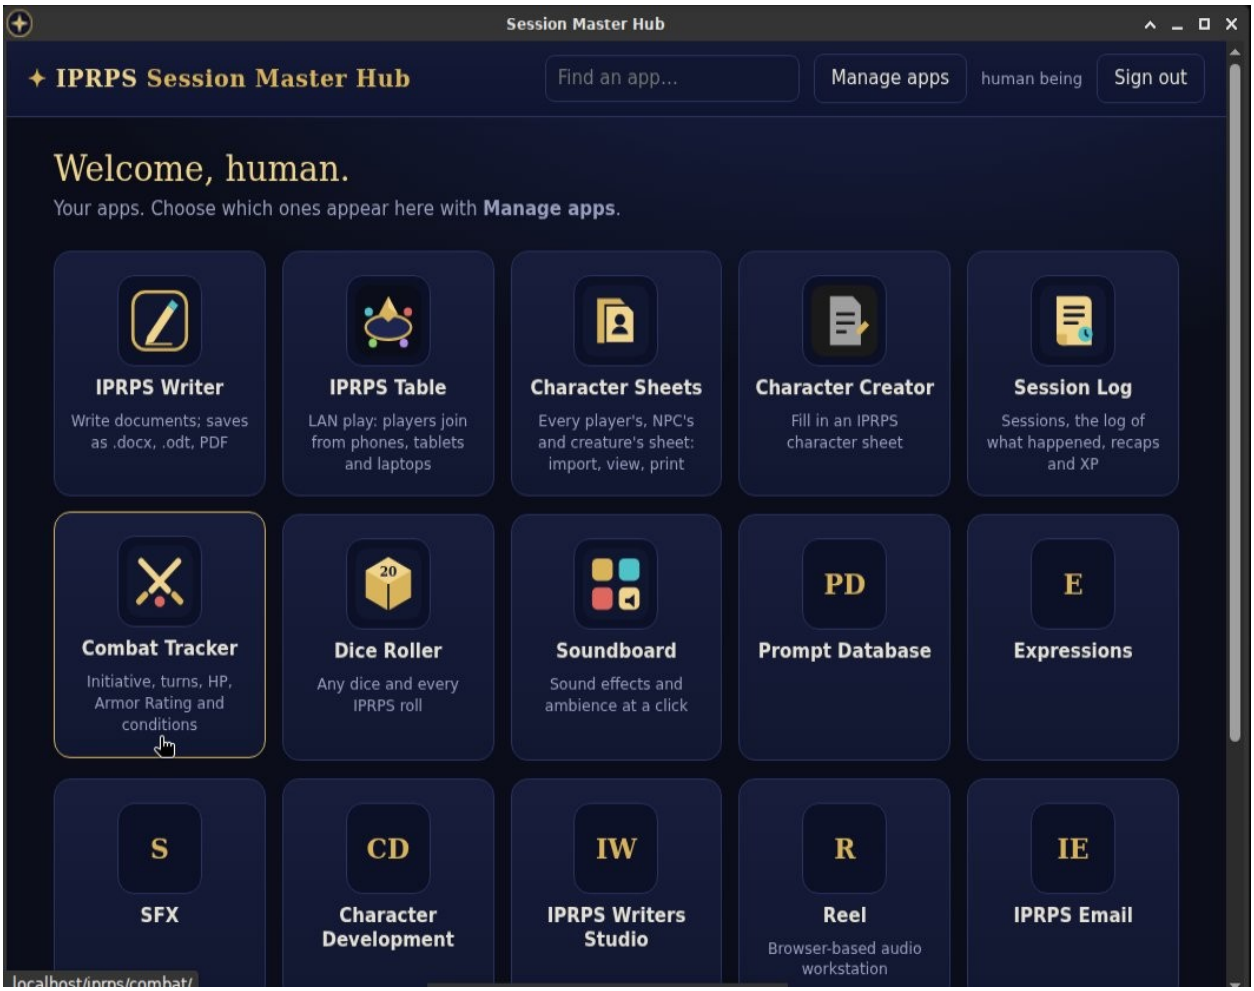

IPRPS Welcome's "Your tools" step: every IPRPS app, with a short description and an Open button

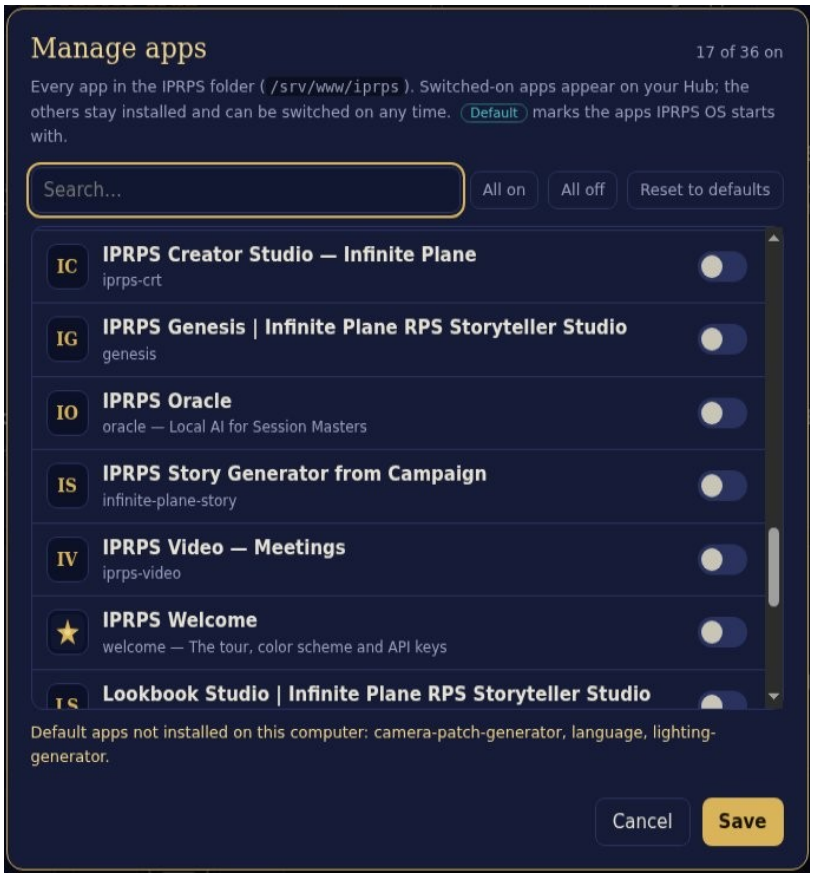

API keys are stored **encrypted**, for your account only, and never leave the computer. The offline tools (Combat, Dice, Session Log, Character Sheets, the Table and the Oracle) need no keys at all.

Run sessions

- **Session Master Mode** opens the Session Master Hub, starts your ambience playlist and, with a second monitor or projector, puts a full-screen **player display** there. On a computer with **one screen**, it opens the **IPRPS Table** instead.
- **The Session Master Hub** is your home page: the campaign apps you use as tiles. **Manage apps** lists every IPRPS app on the computer with an on/off switch, and each Session Master keeps their own choice.
- **The player display** shows players only what you reveal on the second screen.

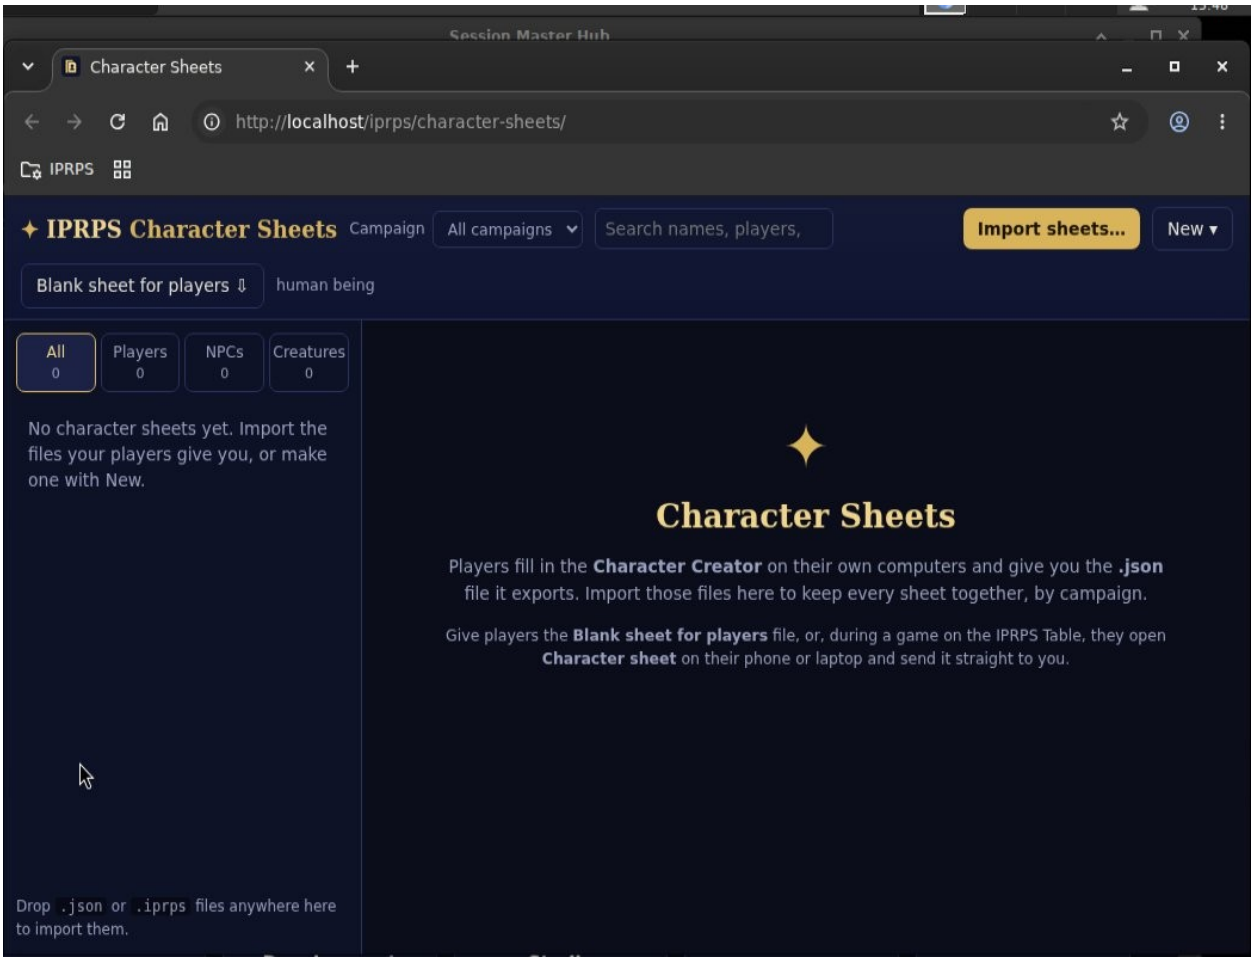

The Session Master Hub: IPRPS Writer, the IPRPS Table, Character Sheets, Character Creator, Session Log, Combat Tracker, Dice Roller, Soundboard and more

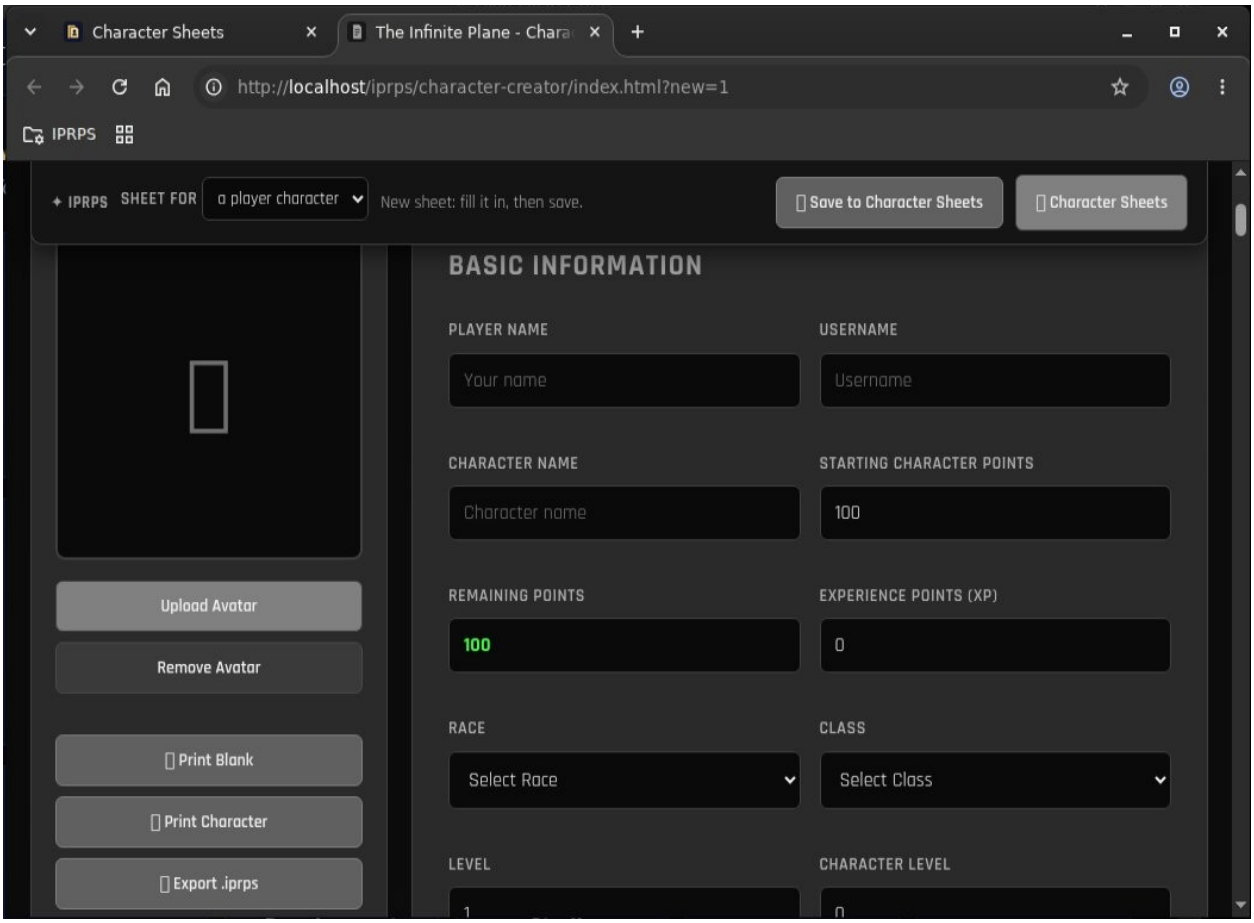

Manage apps: every app installed in the IPRPS folder, switched on or off for your Hub

Character sheets

- **Character Creator** is the IPRPS character sheet: attributes with their Development Point costs, skills, advantages, spells and a portrait. Players fill it in on their own computers (it's one file you can hand out), or on the IPRPS Table during a game, and give you the `.json` file it exports.
- **Character Sheets** is your library: import players' files (several at once, or drop them on the window), view and print them, and keep them by campaign. **New** makes NPC and creature sheets; in Medium and Advanced, the IPRPS Oracle writes complete NPC and creature sheets for you.

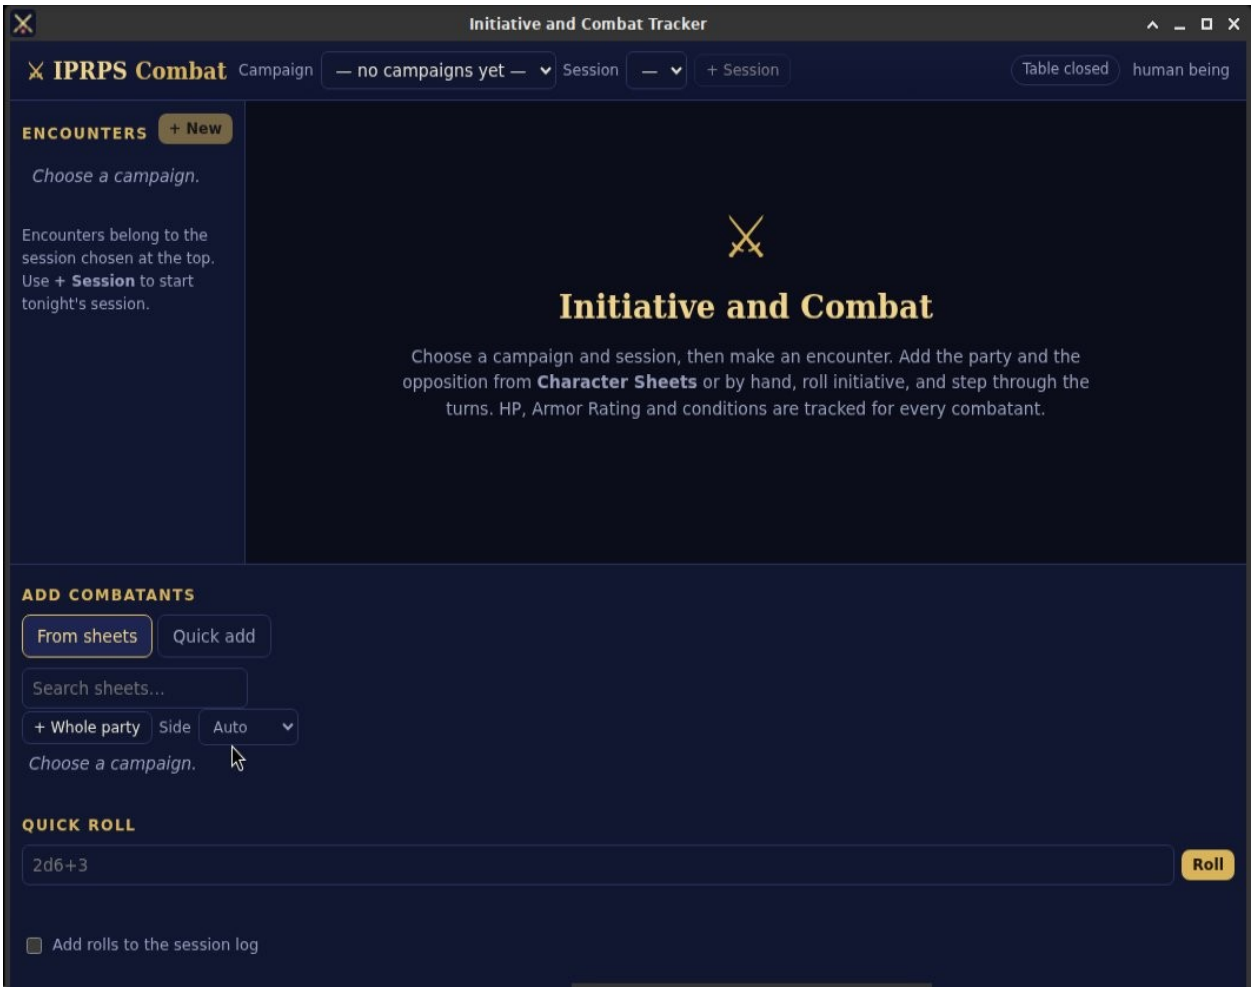

Character Sheets: the Session Master's library of player, NPC and creature sheets, by campaign

The Character Creator: the IPRPS character sheet, saved straight to Character Sheets

Combat, dice and the session log

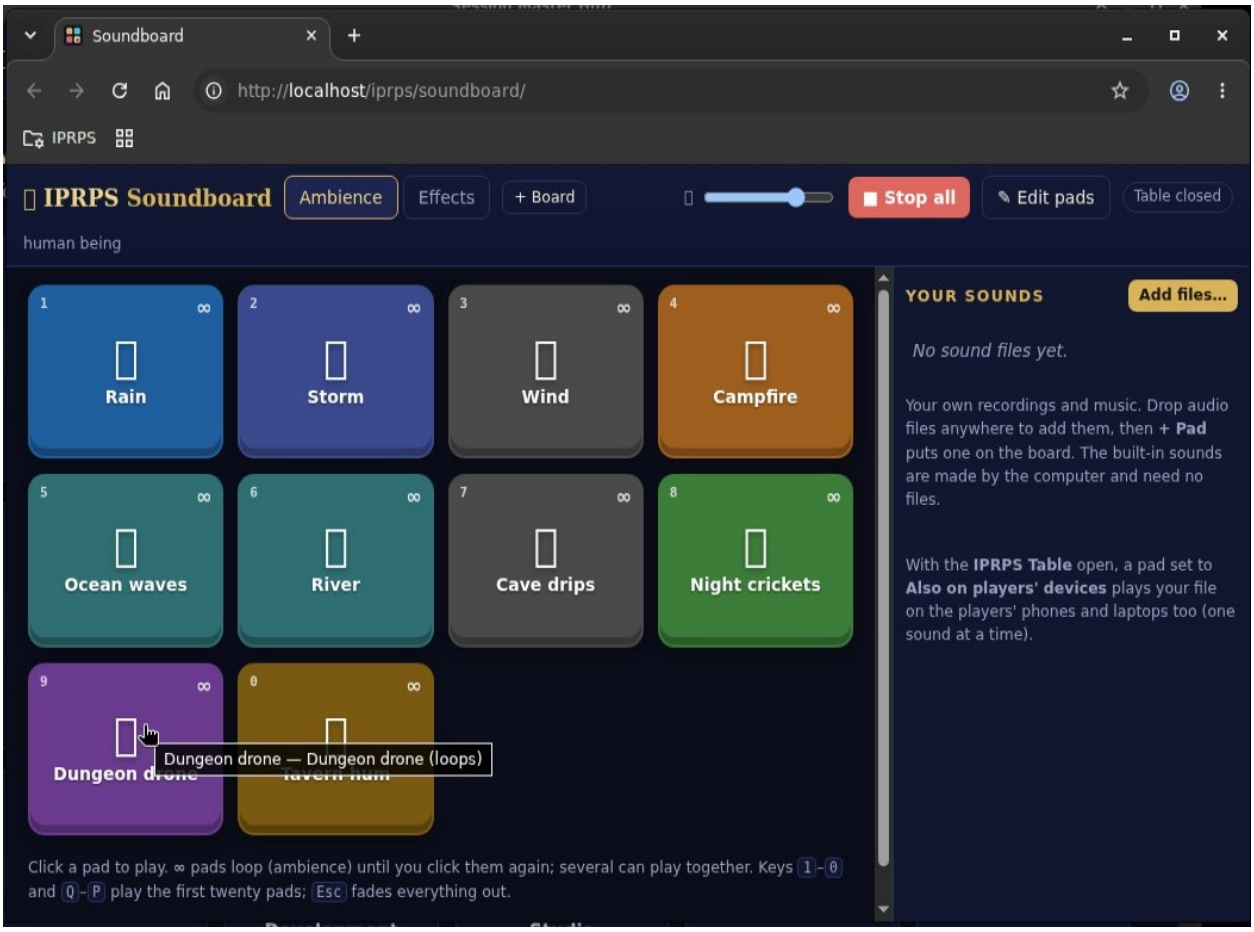

- **Initiative and Combat Tracker:** encounters for each session, combatants from Character Sheets (the whole party at once) or added by hand, initiative, turns and rounds, HP with Armor Rating, conditions, and all five IPRPS combat modes. It can show the turn order to players.
- **Dice Roller:** any dice, and every IPRPS roll and weapon from the Table's dice rules, with a history; rolls can go into the session log and be shown to players, or stay secret.
- **Session Log and Recap:** each session's timeline of notes, events, combat, rolls, loot and XP, attendance, Session Master notes, and the recap (drafted from the log, or by the Oracle in Medium and Advanced), ready to show players next time.

The Initiative and Combat Tracker: encounters, combatants from character sheets, and a quick roll

Sound: the Soundboard

The **Soundboard** puts ambience and sound effects one click away: rain, storm, wind, campfire, ocean, river, cave drips, night crickets, a dungeon drone and a tavern hum loop until you click them again, and 16 effects (thunder, sword clash, arrow, spell, gong, war horn, level up and more) play once. The built-in sounds are made by the computer as they play, so they need no files and no internet. Add your own recordings and music, make boards for a tavern or a battle, and play pads with the keyboard. With the IPRPS Table open, a pad can play your file on the players' devices too.

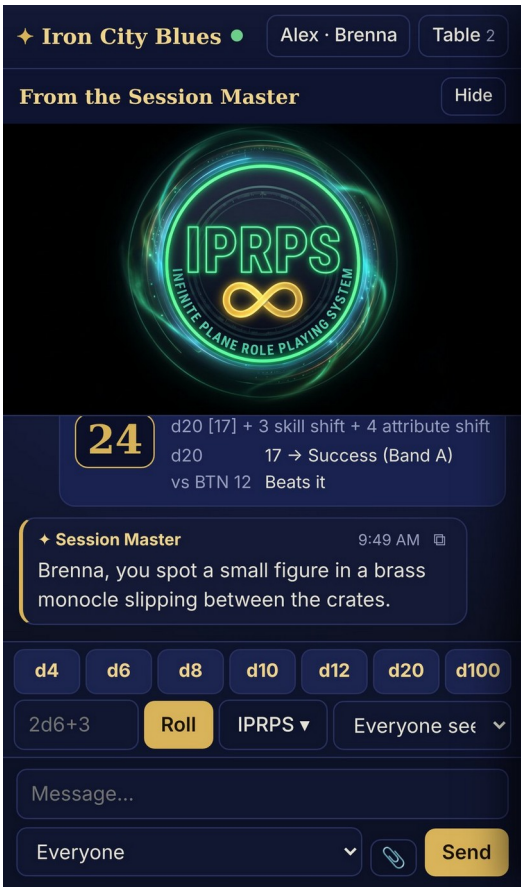

The Soundboard's Ambience board: ten looping sounds, with your own files on the right

Play over the local network: the IPRPS Table

Open the table and your players join from their own devices: they open the address shown in your console, or scan its QR code, and type the join code. No app to install, and no internet needed.

Players can:

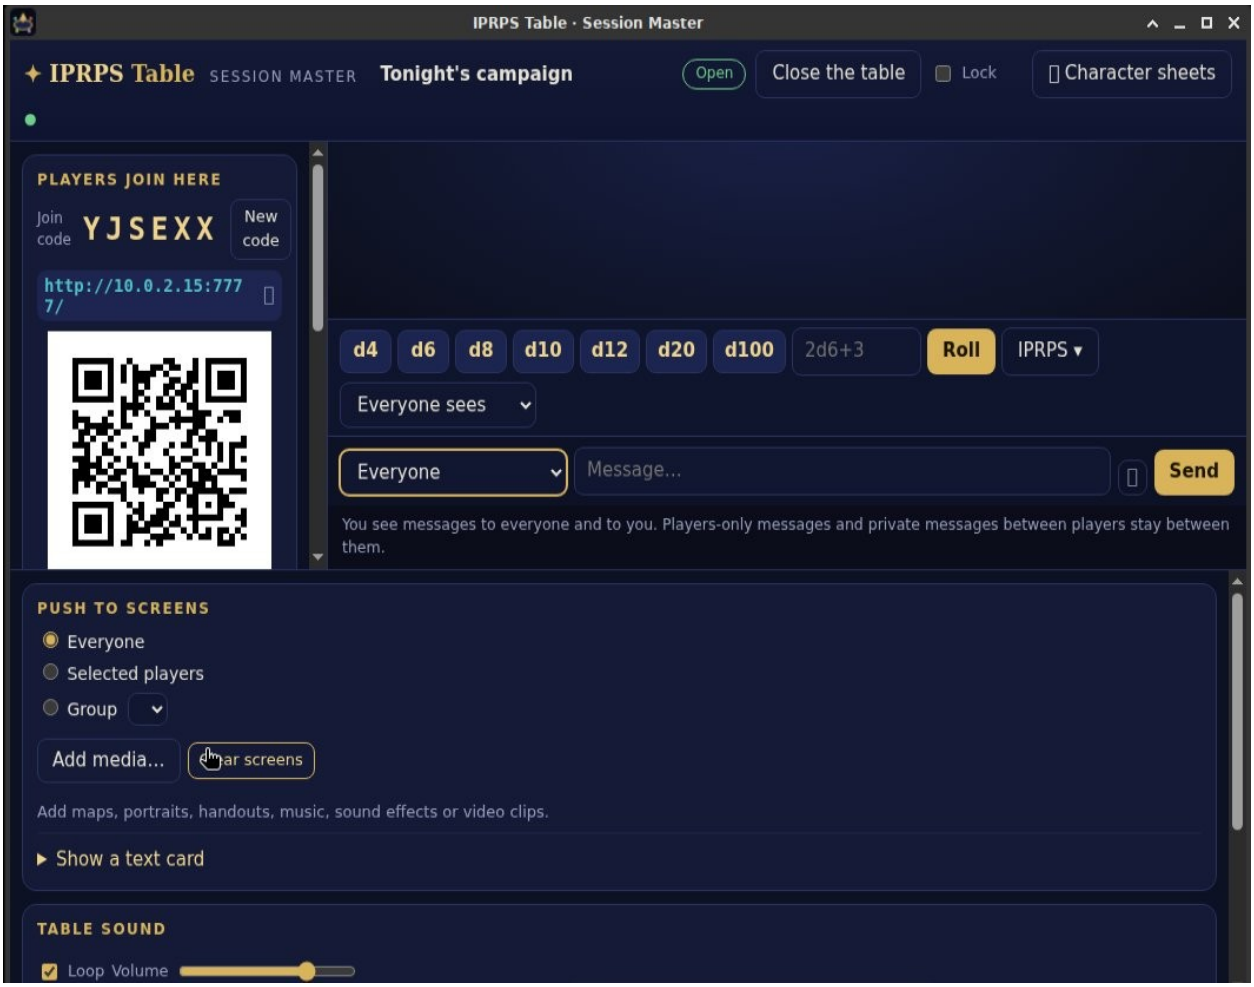

- chat with everyone, with the other players only, privately with the Session Master, or privately with another player, attaching images (pasting works) and audio files
- see whatever the Session Master pushes to them: maps, handouts, video clips and text cards, at the top of their screen
- hear music and sound effects the Session Master plays on their device
- roll from a dice toolbar: d4 to d100, any expression such as `2d6+3`, and the **IPRPS rolls**: skill checks with their success bands and BTN, initiative, reaction, Trinity and Hydra Hand, Dual-Die attacks, Infinite Convergence with exploding dice, RPS stances and weapon damage, each visible to everyone, only the Session Master, or only the roller
- open their **character sheet** and send it straight to the Session Master

A player's phone at the table: an image pushed by the Session Master, a skill check with its band and BTN, and the dice toolbar

The Session Master can:

- see who has joined, whether they're online, and what device they're on
- make groups of players for a split party
- message everyone, a group, selected players or one player
- push images, video and text, and play sound, to everyone, a group or selected players
- open **Character sheets** in the console, import the sheets players send, and show a sheet to players
- roll in secret, copy any message or roll, and remove a player or lock the table

The IPRPS Table console on the Session Master's computer: join code and QR code, dice, chat, and media to push to players' screens

Every roll is made on the Session Master's computer, so nobody can fake one. The Session Master doesn't see players-only or player-to-player private messages.

Remote players: join from another city or state

A player who can't be in the room can still take a seat at the IPRPS Table. Both computers install **Tailscale**, a free app that links them into a small private network over the internet, encrypted end to end. The remote player then joins exactly like someone on your Wi-Fi, at an address your Table console lists, with the same join code, chat, dice, media and character sheets, and the Table treats them as a local player.

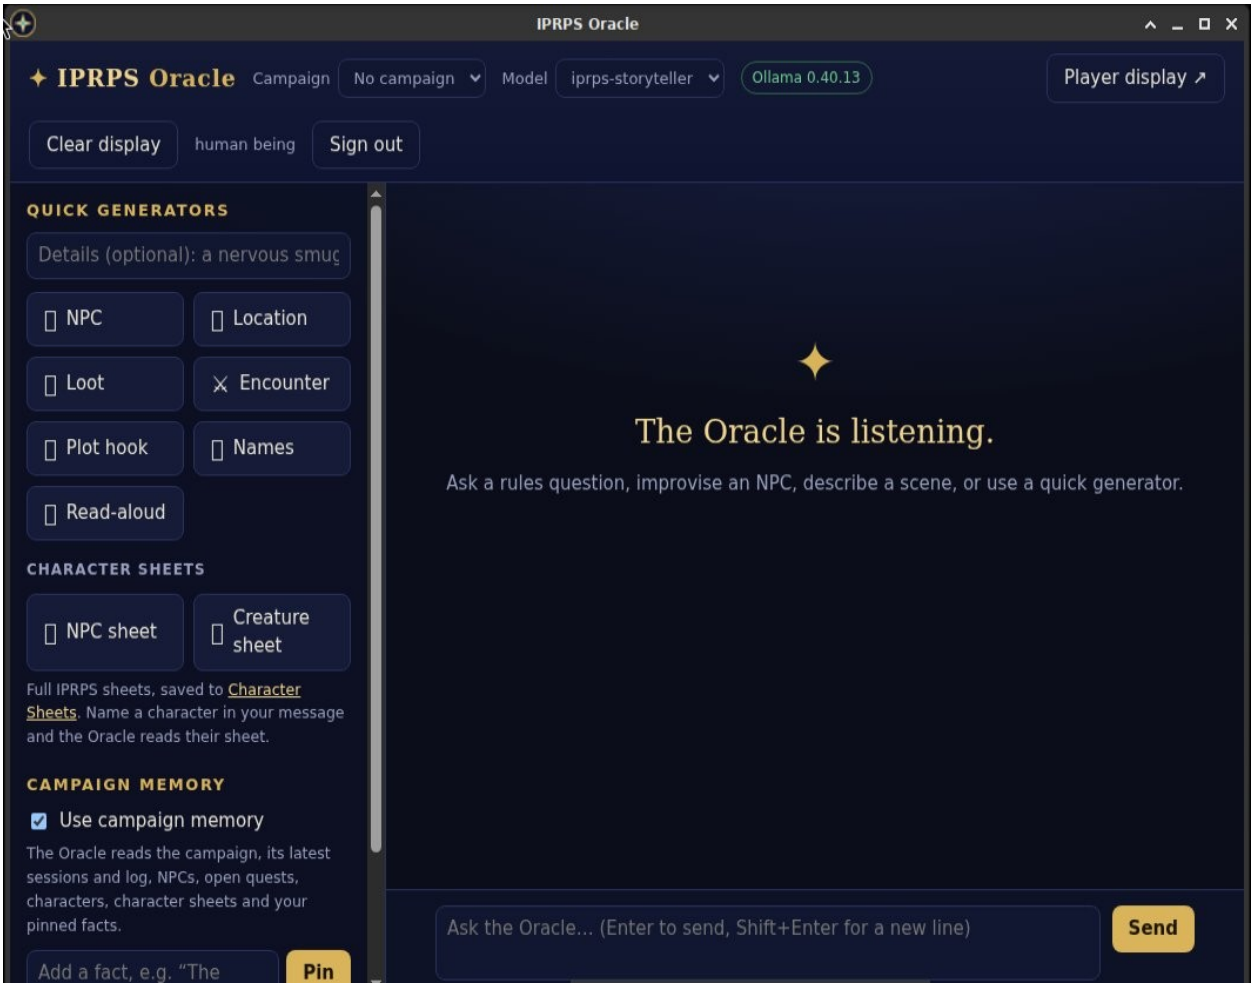

- **Nothing in IPRPS OS changes.** One script, `iprps-remote-play.sh` from the IPRPS OS repository, installs Tailscale on the Session Master's computer in a folder of its own and signs it in; `remove` takes it out again. No router settings are needed on either side.
- **Players install the Tailscale app** on Windows, macOS, Linux, iPhone, iPad or Android, make a free account, and accept your invite.
- **They see only the Table.** You share just your IPRPS computer with each player, and one access rule lets them reach only the Table, not your other devices or apps. The table still opens only when you open it, and only with the join code.
- **Try it first** with a phone on mobile data, Wi-Fi off. Images and video you show come from your home internet's upload, so short clips work best.

Tailscale's free Personal plan covers home campaigns (up to 6 users, non-commercial use). The build guide's Appendix G and `docs/REMOTE-PLAYERS.md` have the full steps.

Get help from the IPRPS Oracle (Medium and Advanced)

The **IPRPS Oracle** is a storyteller AI for Session Masters that runs **entirely on your computer**: no internet, no account, no API key, and nothing leaves the machine.

- **Ask anything** about your scene, or use the quick generators: NPC, location, loot, encounter, plot hook, names, and read-aloud descriptions.
- **Character sheets: NPC sheet** and **Creature sheet** write complete IPRPS sheets and save them to Character Sheets. Name a character in your message and the Oracle reads their sheet.
- **It knows your campaign.** It reads the campaign, its latest sessions and log, NPCs, open quests, characters, character sheets and facts you pin.
- **Show players** sends a description to the player display.

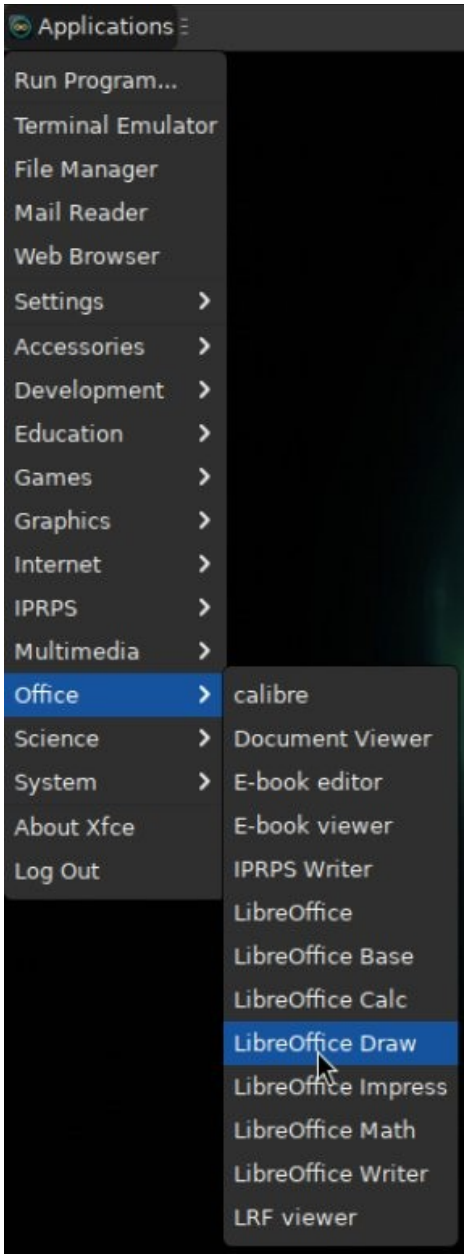

The IPRPS Oracle: quick generators, character sheets and campaign memory on the left, the conversation on the right

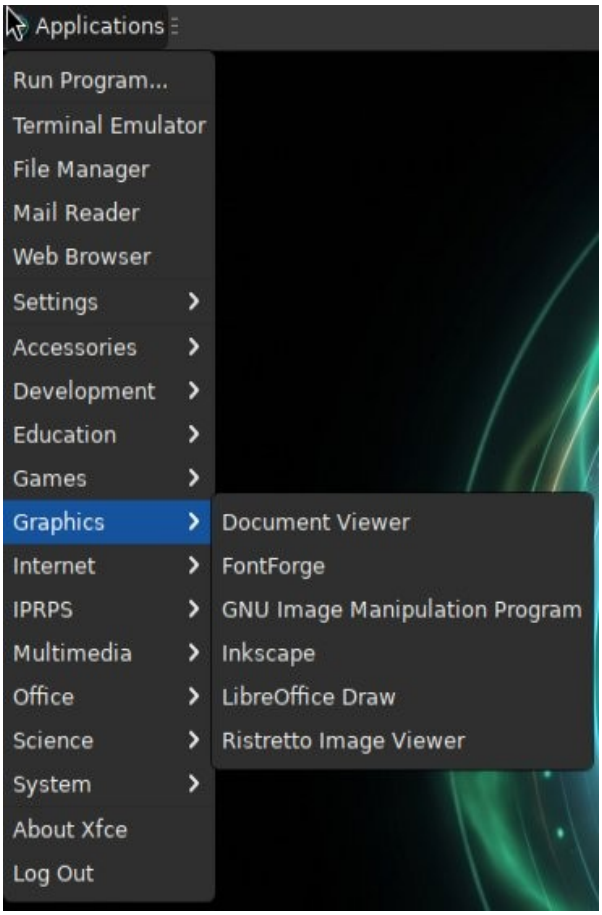

Create

- **Write:** IPRPS Writer for session notes and lore (opens and saves Word and OpenDocument files, and prints to PDF), Mousepad for quick notes, LibreOffice for rulebooks (Medium and up), and the IPRPS Writing Assistant (Medium and up).

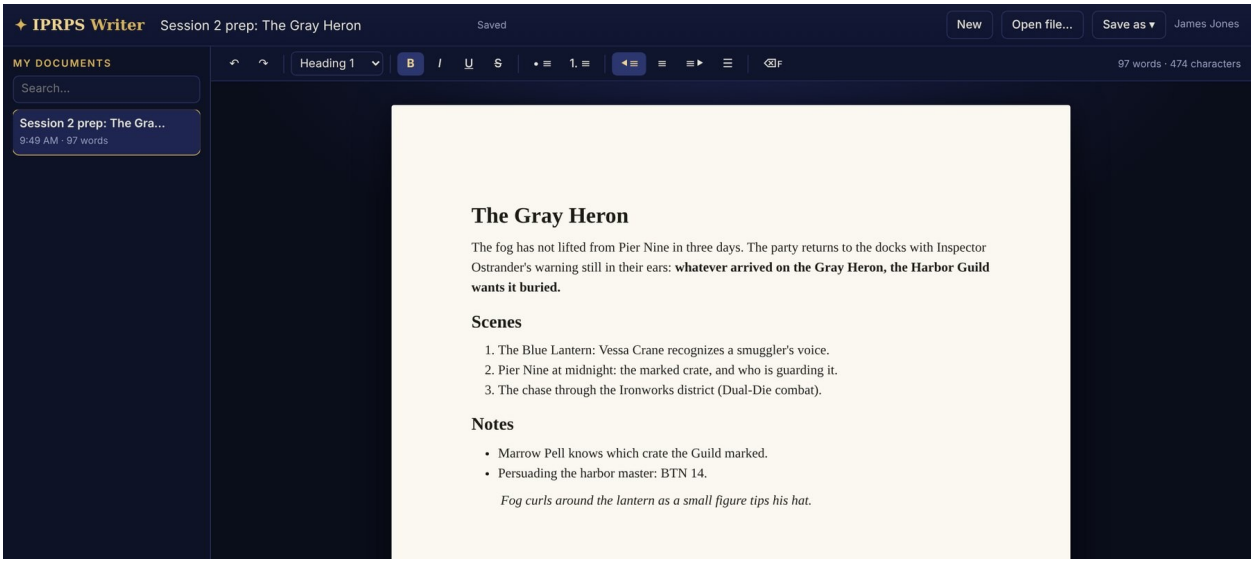

- **Draw and map:** Drawing for quick sketches (Lite), GIMP for images and Inkscape for maps and character sheet layouts (Medium and up), FontForge for fonts and symbols, Krita for painting and Blender for 3D (Advanced).
- **Sound:** the Soundboard and Parole for music and ambience, Audacity for narration and effects, LMMS for soundtracks (Advanced).
- **Video:** mpv and VLC for playback, Shotcut and Kdenlive for trailers and session recaps (Advanced).
- **Publish:** Scribus for print layout, Calibre for e-books, Pandoc for converting documents (Advanced).
- **Print:** character sheets, handouts and maps, with CUPS printer support (Medium and up).
- **IPRPS files:** the **IPRPS File Viewer** opens and checks `.iprps`, `.ipai`, `.srpatch` and `.capstone` files: required fields and sections, ranges and Development Points.

The Office menu (Advanced): Calibre and its e-book tools, Document Viewer, IPRPS Writer and LibreOffice

The Graphics menu (Advanced): Document Viewer, FontForge, GIMP, Inkscape, LibreOffice Draw and Ristretto

IPRPS Writer with a session-prep document

Status of the IPRPS tools in version 1.0

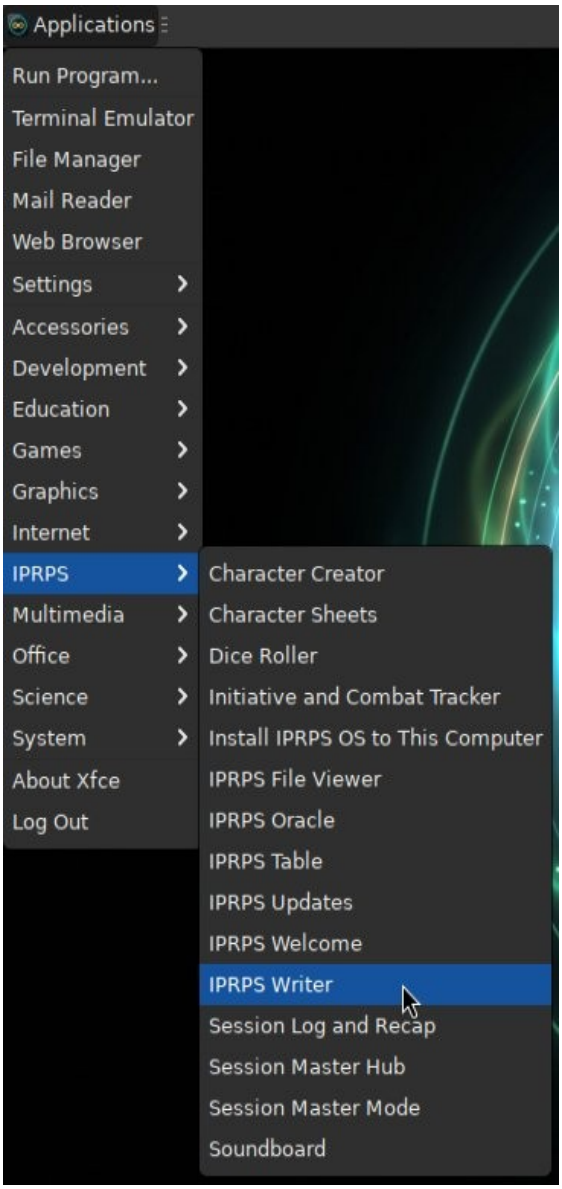

Tool	What it does	Status
Session Master Hub	Home page with your apps; Manage apps per account	Included
IPRPS Table	Play over the local network: chat, IPRPS dice, pushed images, video and sound, character sheets	Included
Remote players	Players in another city or state join the Table through Tailscale, encrypted	Optional (one script, no change to IPRPS OS)
Character Creator and Character Sheets	The IPRPS character sheet; the Session Master's library of player, NPC and creature sheets	Included
Initiative and Combat Tracker	Encounters, initiative, turns, HP with Armor Rating, conditions, five combat modes	Included
Dice Roller	Any dice and every IPRPS roll, logged and shown to players	Included
Session Log and Recap	Each session's timeline, attendance, XP and recap	Included
Soundboard	Built-in ambience and effects, your own files, Table playback	Included
IPRPS Writer	Word processor; .docx, .odt, .txt, .html and PDF	Included
IPRPS File Viewer	Opens and checks .iprps, .ipai, .srpatch and .capstone files	Included
IPRPS Welcome	First-login tour, color scheme, encrypted API keys	Included
IPRPS Updates	Security fixes, new app versions and optional software, without reinstalling	Included
Player display	Full-screen view for players on a second screen	Included
IPRPS Oracle	Local storyteller AI with campaign memory and character sheets	Included (Medium and up)
Campaign database	Campaigns, sessions, the session log, encounters, character sheets, NPCs, quests	Included
Universal Login	One sign-in for all local IPRPS apps	Included

Tool	What it does	Status
IPRPS Media Player	Music, ambience, CDs, DVDs and IPRPS radio	Included (Medium and up)
Genesis Character Engine	AI character reference sheets	Included (Medium and up; needs internet and your API key)
IPRPS Writing Assistant	AI-assisted writing for lore and prep	Included (Medium and up; needs internet and your API key)
AI Session Master	One place for AI profiles, patches and capstones	Planned (an update, then 1.1 Medium and Advanced)
IPRPS CD/DVD Player	Discs at the table	Planned (an update, then 1.1 Medium and Advanced)

The IPRPS Desktop and Session Master Mode

The IPRPS Desktop is a customized Xfce desktop: light enough for 6 GB machines, with everything for play one click away.

- **IPRPS menu:** every IPRPS app in one category of the applications menu. In Medium and Advanced each IPRPS app opens in its own window, like a desktop program.
- **Dock and panel:** launchers at the bottom, and volume, network, clock and account at the top.
- **Wi-Fi:** a simple Wi-Fi window lists nearby networks and connects with a password; the network icon handles the rest.
- **Look:** IPRPS branding on the boot menu, login screen and wallpaper, a dark theme, and **72 IPRPS icons**: home and the standard folders, every other folder, Trash, File System, the file manager, terminal, browser, settings, the menu, and the IPRPS apps. In the file manager, system folders (`/usr`, `/etc`, `/var`…) and campaign folders (Campaigns, Maps, NPCs, Players, Creatures, Dungeons, AI Profiles and more) each get their own icon.
- **Your folders:** each user gets a *Campaigns* folder with *Handouts*, *Maps* and *Audio* inside, ready for session material.

The IPRPS menu: every IPRPS app in one place

The IPRPS login screen artwork

Session Master Mode is the heart of game night. One click:

1. opens the **Session Master Hub**
2. plays your *Campaigns/Audio* folder as shuffled, looping **ambience**, in a small window with play, pause and volume controls
3. with a **second screen**, opens the **player display** full screen there; with **one screen**, opens the **IPRPS Table** console so players can join from their own devices
4. in Medium and Advanced, warms up the **IPRPS Oracle** so its first answer comes quickly

You run the game from the Hub on your screen; players see only what you share.

Getting IPRPS OS

Each edition is one compressed disk image. Write it to a USB stick, boot from it, and IPRPS OS is ready; installing to the computer's internal disk is optional.

Download: infiniteplane.space/downloads/iprps/1.0. The source code, build guide and release notes are on GitHub at **github.com/chiitascaran-collab/iprps-linux-distro**.

File	Use it for
`iprps-os-1.0-<edition>.iso`	**Try it first:** a live DVD or USB stick that runs in memory without touching your disks, and installs from there
`iprps-os-1.0-<edition>.img.xz`	A USB stick or an internal disk; boots on UEFI and BIOS computers
`iprps-os-1.0-<edition>.vhdx`	Trying it in Hyper-V on Windows
`iprps-os-1.0-<edition>.qcow2`	Trying it in QEMU, virt-manager or Proxmox
`SHA256SUMS-<edition>`	Checking that your download is complete and unaltered

From download to desktop:

1. Check the download against `SHA256SUMS`.
2. Write the `.img.xz` to a USB stick with **Rufus** or **balenaEtcher**. Everything on the stick is erased. To run IPRPS OS from the stick day to day, use one of 64 GB or more; the system grows to fill it.
3. Turn off **Secure Boot** in the computer's firmware settings.
4. Boot from the stick, using the computer's one-time boot menu (often F12, F11, F8 or Esc).
5. **First boot:** IPRPS OS expands to fill the stick, creates swap space, and asks for your user name, full name, password, computer name and time zone.
6. Log in. IPRPS Welcome opens on the IPRPS Desktop.

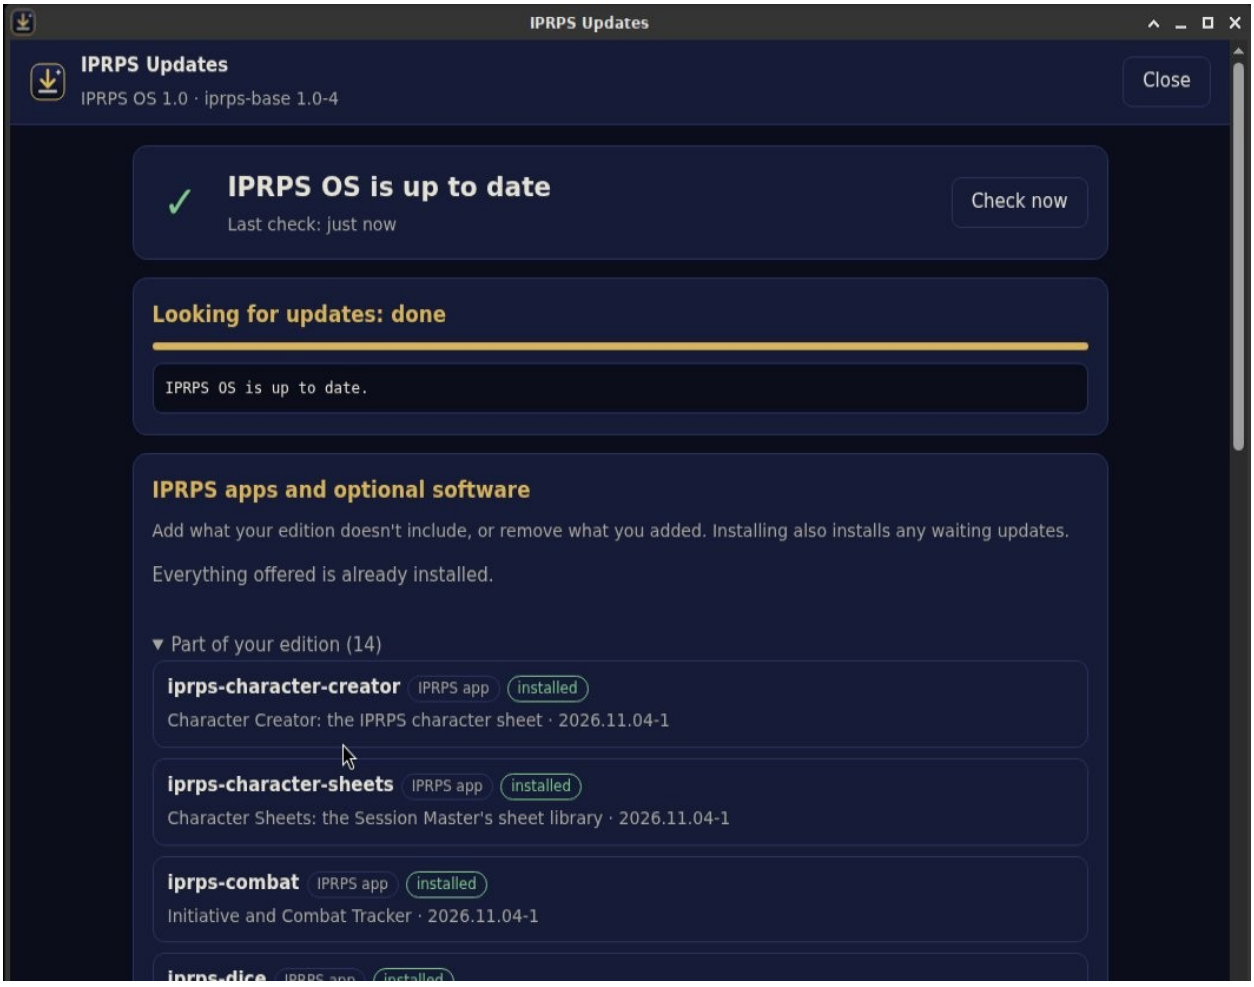

To install on the computer itself: run *Install IPRPS OS to This Computer* from the IPRPS menu, choose the internal disk, and confirm. That disk is **completely erased**, so back up anything you need first.

To try it without touching your PC: (the live session keeps everything in memory, so to try the IPRPS Oracle there, use a computer with 12 GB or more) start the live `.iso` from a DVD (Windows: right-click it, **Burn disc image**) or a USB stick (balenaEtcher, or Rufus in DD Image mode), or use the `.vhdx` in Hyper-V (Generation 2, Secure Boot off) or the `.qcow2` in QEMU.

Updates: IPRPS Updates

IPRPS OS updates itself in place, like other modern systems: **no reinstalling** for security fixes or new versions of the IPRPS apps.

- **Automatic checks.** About 10 minutes after starting, and every 6 hours while online, IPRPS OS looks for updates. Administrators get a desktop notification when updates are ready, and the Hub's **IPRPS Updates** tile shows them.
- **One click.** Open **IPRPS → IPRPS Updates**, enter your password, and click **Install updates**. Your campaigns, sheets, settings and files are kept.
- **Optional software.** The same window lists IPRPS apps and optional software your edition doesn't include, with **Install** and **Remove**; anything that needs a bigger edition says so.
- **Safe.** Every update is signed by IPRPS OS, and computers refuse anything that isn't. An update either installs completely or not at all.
- **In a terminal,** administrators can use `sudo iprps-update` (status, `check`, `upgrade`, `extras`, `install`, `remove`).

IPRPS Updates: up to date, with the IPRPS apps that are part of this edition

New point releases (1.0.1, 1.1…) arrive the same way: the update changes the version shown everywhere, and brings any new IPRPS apps for your edition.

Your data and privacy

Your campaigns, players and session records stay on your computer. Nothing is sent anywhere unless you use an online feature.

- **Local web server.** The IPRPS apps run on a web server (Apache with PHP) that accepts connections **only from the computer itself**.
- **The IPRPS Table** is the one part that other devices can reach, and only while you have a table **open**, only on your local network (or, if you set up remote players, through your own encrypted Tailscale network, limited to the Table), and only with the join code. Its console opens only on your computer. Closing the table disconnects everyone; after a restart the table is always closed.
- **Local database.** Campaign data lives in a MariaDB database with no network port at all. Each installation gets its own randomly generated database password on first boot.
- **Local AI.** The IPRPS Oracle runs on your computer and listens only to it. Your campaign never leaves the machine.
- **Your accounts.** Each person who uses the computer gets their own account, files and settings. The first user can administer the system with their own password; the root account is locked.
- **Online AI apps are opt-in.** The Genesis Character Engine and the Writing Assistant send your prompts to an online AI service using **your own API key**, kept encrypted by IPRPS Welcome. No keys ship with IPRPS OS. Without a key and internet, those two apps don't work; everything else does.
- **Update checks** download the package lists from infiniteplane.space: an ordinary web request, with nothing about you or the computer sent. Switch them off in IPRPS Updates (**Settings**).
- **No telemetry.** Nothing reports home. Firefox and Chromium ship with tracking, studies and promotions switched off.
- **Player data.** If you store players' real names or contact details, you're responsible for keeping them safe. Back up your *Campaigns* folder and the campaign database regularly.

Customization and open source

Make it yours. IPRPS OS ships ready to use, but nothing is locked down:

- the first user has `sudo` for full administrator access
- compilers and build tools are included, so you can add any software from source, following the Beyond Linux From Scratch book
- drivers for nearly all hardware are included as loadable modules, and you can rebuild the kernel for your exact machine
- the desktop's theme, panel, menus and icons are standard Xfce settings you can change, and each person picks a color scheme for the IPRPS session tools
- the IPRPS Table's dice buttons are a settings file you can edit, and **Manage apps** chooses what the Hub shows

Open source. IPRPS OS is built from open-source software. For each release, the complete source code of its open-source components is published, as their licenses require. A few choices keep the system legally redistributable:

- **Firefox** is built without Mozilla's official branding, so it carries a generic name and icon; it's the same browser. **Chromium** is the open-source, ungoogled build.
- **Media formats.** FFmpeg is built without its non-free options, and some patent-encumbered hardware video acceleration is turned off. Common formats still play; users who need more can add it themselves where it's legal.
- **Firmware.** Hardware firmware comes from the official linux-firmware collection, with its license texts included.
- **The Oracle's model** is an openly licensed (Apache-2.0) language model with IPRPS instructions on top.

IPRPS apps are by Mythical Legends Publishing; each app states its own license. IPRPS OS's own system scripts, configuration, apps it adds (the Hub, the IPRPS Table, IPRPS Writer, the IPRPS Oracle, the session tools, IPRPS Updates), icons and build guide are free software under the GNU General Public License, version 2.

Future expansion

These are plans, not promises, and dates aren't set; each release's notes say what actually shipped.

1. **Version 1.0:** the three editions, Session Master Mode, the Hub, the IPRPS Table, character sheets, the session tools, the Soundboard, IPRPS Writer, IPRPS Updates and, in Medium and Advanced, the IPRPS Oracle.
2. **AI Session Master:** one app as the entry point to AI profiles, profile patches, session run patches and capstones. It arrives first as an update through IPRPS Updates, then comes included in **version 1.1** of Medium and Advanced.
3. **IPRPS CD/DVD Player** for music and video discs at the table: the same way, first as an update, then included in version 1.1 of Medium and Advanced.
4. **More optional software** through IPRPS Updates, such as Advanced's creative apps for Medium, and the Oracle for Lite on 16 GB machines.
5. **A custom-trained IPRPS model** for the Oracle, which can replace the bundled one without changing the app.
6. **A persistent live USB** that keeps your changes, and a graphical installer.

Follow infiniteplane.space and the GitHub repository for announcements.

Frequently asked questions

Is IPRPS OS free? Yes, the operating system is free to download and use. IPRPS apps state their own licenses.

Do I need to know Linux? No. First-boot setup, IPRPS Welcome, the desktop, IPRPS Updates and the IPRPS apps are point-and-click. Linux knowledge helps only if you want to customize the system deeply.

Can my players use their own phones or laptops? Yes, with the IPRPS Table. Players on the same network open the address or scan the QR code shown in your console, enter the join code, and they're at the table: chat, dice, their character sheet, and anything you push to them. They don't need IPRPS OS, an app or an account; any web browser works.

Can a player in another state join my game? Yes. Install Tailscale on your computer with the IPRPS script and invite the player; they install the Tailscale app, accept, and join the IPRPS Table like everyone else, over an encrypted connection (*Remote players*, above). IPRPS OS itself doesn't change.

How do players get their character sheets to me? Give them the Character Creator file (Character Sheets → **Blank sheet for players**), or have them open their sheet on the IPRPS Table. They send you the finished sheet, and you import it in Character Sheets.

I only have one monitor. Can I still run a game? Yes. Session Master Mode opens the IPRPS Table instead of a player display when there's one screen, and your players follow on their own devices.

Does it need the internet? No, not for running games. The Hub, the IPRPS Table, the session tools, the Soundboard, IPRPS Writer and the IPRPS Oracle all work offline. You need internet to download IPRPS OS, for updates, and for the online AI apps (Genesis Character Engine, Writing Assistant).

How is the IPRPS Oracle different from the online AI apps? The Oracle runs on your computer, needs no account or key, and keeps your campaign private. The online apps use a larger AI service over the internet with your own API key.

How do I get updates? IPRPS Updates tells you when they're ready; open it and click **Install updates**. No reinstalling, and your campaigns and files stay as they are.

Can I keep Windows on the same computer? Not with the 1.0 installer, which erases the target disk. You can run IPRPS OS from a USB stick instead, install it on a second disk, or try it in a virtual machine on Windows.

Can I play my Windows games on it? No. IPRPS OS is built for running and creating tabletop RPGs, not for Windows games.

Will my Wi-Fi, sound and graphics work? On most Intel and AMD computers, yes: drivers and firmware for common hardware are included. A few Broadcom Wi-Fi chips aren't supported. NVIDIA graphics use the open-source driver, which works for the desktop but has limited 3D performance. If the screen stays black, choose *IPRPS OS (safe graphics)* in the boot menu.

Can several people use one computer? Yes. Each person gets their own account with separate files, documents, color scheme and Hub choices.

Where's the source code? On GitHub, at github.com/chiitascaran-collab/iprps-linux-distro, with the complete build guide.

Glossary

Term	Meaning
IPRPS	Infinite Plane Role Playing System, the tabletop RPG system by Mythical Legends Publishing
Session Master	The person who runs a game session (often called a game master)
Storyteller	A writer or worldbuilder who creates campaigns, lore and settings
Edition	One of the three versions of IPRPS OS: Lite, Medium or Advanced
Session Master Mode	One-click setup for game night: the Hub, ambience, and the player display or the IPRPS Table
Session Master Hub	The home page of the Session Master's apps
IPRPS Table	Play over the local network: players join from their own devices to chat, roll dice and see what the Session Master shares
Join code	The six-character code players type to join an open IPRPS Table
Remote player	A player in another place who joins the IPRPS Table through Tailscale, an encrypted private network between the two computers
IPRPS Oracle	The storyteller AI that runs on your computer (Medium and Advanced)
IPRPS Updates	The window (and `iprps-update` command) that installs updates and optional software
Player display	A full-screen window for players on a second screen, showing what the Session Master reveals
BTN and AR	Base Target Number and Armor Rating, the IPRPS targets for rolls and damage
Development Points (DP)	What characters are built with in IPRPS; the Character Creator counts them
Disk image	A single file containing a complete, bootable copy of the system, written to a USB stick or disk
Secure Boot	A firmware setting that only allows signed systems to start; it must be off for IPRPS OS
Firmware	Small programs some hardware (Wi-Fi, graphics) loads to work
sudo	The command that lets an authorized user run administrator tasks
Linux From Scratch (LFS)	The book IPRPS OS's base system is built from, compiled entirely from source code

Term	Meaning
.iprps, .ipai, .srpatch, .capstone	IPRPS file formats for characters, AI profiles, session run patches and capstones
